

Utah—a great storehouse of mineral wealth. Here more than two billion dollars in non-ferrous metals have been produced since the first prospecting in 1854. Large scale production commenced with the discovery of the famous old Emma mine at romantic Alta in 1868. Over 250 different minerals have been found within the borders of this state. The Utah copper mine at Bingham is the largest copper producer in the world. Utah also has enormous deposits of coal and iron.
